

MERN Stack Training

Company: Sensation Software Solutions

Student Name: Gurvinder Singh

Training Duration: 6 Months

Days: 97

Objective of the Day

The objective of **Day 97** was to **strengthen frontend architecture and improve user interface consistency** of the *JourneyJoy Tour & Travel Booking System*. The focus of the day remained on **frontend development**, including **component refinement, state handling, UI polish, and navigation improvements**, while keeping backend work minimal and preparatory in nature.

Overview of Work Done on Day 97

On Day 97, the work revolved around improving existing UI components and adding structure to the JourneyJoy frontend. The project already had basic pages and routing set up earlier, so the focus shifted towards **UI refinement, component reusability, and better data handling using mock data**.

Key areas addressed included:

- Navigation bar enhancement
 - Footer layout improvement
 - Home page content structuring
 - Tours page layout optimization
 - Preparation of Tour Details page flow
 - Improving overall user experience (UX)
-

Frontend UI Enhancements

1. Header & Navigation Improvements

The **Header component** was refined to provide a professional and user-friendly navigation experience.

Work done:

- Improved navigation menu alignment using Tailwind Flexbox utilities.

- Added active link styles for better user awareness.
- Ensured menu items were clearly visible on different screen sizes.
- Organized menu options as:
 - Home
 - Tours
 - About
 - Contact
 - Login
 - Signup

Special attention was given to:

- Consistent spacing
- Font sizes
- Hover effects
- Mobile responsiveness

The navigation bar now behaves like a real travel website, making it easy for users to move between pages.

2. Footer Section Design

A structured **Footer component** was designed and implemented to improve site completeness and branding.

Footer included:

- Company name (JourneyJoy)
- Short description of the travel platform
- Quick links (Home, Tours, Contact)
- Copyright notice

The footer was styled using Tailwind CSS with:

- Grid layout
- Proper padding and margins
- Responsive behavior for small devices

This helped the website feel more complete and professional.

Home Page Content Structuring

The **Home page** was further enhanced to better communicate the purpose of the JourneyJoy platform.

Hero Section Refinement

Work done:

- Improved hero section layout
- Added a clear heading describing the travel service
- Added a short tagline encouraging users to explore tours
- Included call-to-action buttons like “Explore Tours” and “Book Now”

This section now gives users an immediate understanding of what JourneyJoy offers.

Featured Tours Section

A **Featured Tours** section was added to the Home page.

Details:

- Displayed sample tour cards using static/mock data
- Each card showed:
 - Tour image
 - Tour title
 - Destination
 - Price
 - Short description
- Used reusable **TourCard** component

This approach helped practice **component reusability**, which is essential in large React applications.

Tours Page Layout Optimization

The **Tours** page was further refined to show multiple tour packages in a structured grid layout.

Enhancements included:

- Responsive grid using Tailwind (`grid-cols-1, md:grid-cols-2, lg:grid-cols-3`)
- Improved card spacing and alignment
- Hover effects for better interactivity
- Clear pricing display

Dummy tour data was used to simulate real backend responses, helping visualize how actual data would appear once APIs are integrated.

Tour Card Component Improvement

The **TourCard component** was improved for better reusability and clarity.

Changes made:

- Props-based data rendering
- Clean separation of UI and data
- Added “View Details” button
- Improved typography and color consistency

This component is now flexible enough to be reused on:

- Home page
 - Tours page
 - Search results page (future scope)
-

Tour Details Page Preparation

Although backend integration was not fully implemented yet, **Tour Details page structure** was prepared.

Work done:

- Created layout structure for Tour Details page
- Planned sections:
 - Tour images
 - Description
 - Itinerary overview
 - Price details
 - Booking button
- Connected “View Details” button to navigate to Tour Details route

This ensured that future backend data integration would be straightforward.

State Management & Routing Practice

Day 97 also focused on improving understanding of **React Router and state flow**.

Tasks included:

- Verified all routes were correctly connected
- Ensured navigation did not cause unnecessary re-renders
- Practiced passing data using route parameters (UI level)

- Maintained consistent layout across all pages

This practice strengthened frontend architectural skills.

Styling Consistency with Tailwind CSS

A major part of Day 97 involved maintaining **consistent UI styling** across the project.

Steps taken:

- Standardized font sizes
- Unified color palette
- Consistent button styles
- Proper spacing using Tailwind utility classes

This consistency is crucial in real-world applications where UI quality directly impacts user trust.

Hands-on Practice & Testing

Manual UI Testing

The application was tested manually to ensure:

- Navigation works correctly
- UI elements are properly aligned
- No broken links exist
- Layout adapts well to different screen sizes

Responsive Testing

The website was tested on:

- Desktop view
- Tablet view
- Mobile view

Responsive issues were fixed using Tailwind responsive utilities.

Backend Preparation (Minimal)

Although backend development was not the main focus of Day 97, some preparatory steps were taken:

- Reviewed planned API structure
- Identified data requirements for:
 - Tours
 - Users
 - Bookings
- Ensured frontend components were backend-ready

This preparation helps reduce integration issues later.

Learning Outcome of Day 97

From Day 97, several important real-world development lessons were learned:

- Importance of UI consistency
 - Value of reusable components
 - Planning frontend before full backend integration
 - Writing scalable and maintainable React code
 - Understanding how UX impacts user engagement
-

Conclusion

Day 97 was a **frontend-focused and design-intensive day** in the JourneyJoy Tour & Travel Booking System project. The application moved closer to a **real-world travel platform look and feel** through UI improvements, better component structuring, and consistent styling.

Although backend work was minimal, frontend preparation was done thoroughly to ensure smooth future integration. The work completed on Day 97 laid a strong foundation for upcoming backend connections, booking flow implementation, and admin functionalities.

Overall, Day 97 significantly enhanced the **visual quality, usability, and structural readiness** of the JourneyJoy project.
